

# CorsoCare clinicians received a modified training for LSVT care!

The course covered a unified and modified approach across physical, occupational, and speech therapies to comprehensively treat cross-system deficits with specific goals and demonstrations of LSVT exercises.

For patients with Parkinson's disease and other neurological conditions, common symptoms can include change in voice (such as monotone speech, breathiness, and difficulty articulating words) and change in mobility (such as tremors, postural instability and changes in gait).

The primary goal of LSVT (Lee Silverman Voice Technique) trainings is to address these difficulties, alleviating symptoms through intensive and repetitive exercises and repetitive exercises. By partnering with Powerback Rehabilitation, now CorsoCare clinicians can offer this care to patients, too.

## LSVT treatment is:

- **Goal-oriented.**  
No two patients are the same. That's why LSVT treatment is personalized to each person's specific needs and goals.
- **Helpful at any stage.**  
LSVT treatment can help patients at any stage or severity of Parkinson's disease.
- **Able to produce significant improvements.**  
For patients facing considerable physical symptoms due to Parkinson's disease, LSVT treatment can significantly improve daily life.

## Did you know?

Parkinson's disease is one of the top six disease types that CorsoCare Home Health clinicians specialize in treating. This training allows CorsoCare to continue to care for seniors and provide them with the personalized care plan they need to recover.
